No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The present invention describes an isolated MHC class II compound (I)

comprising: (a) an MHC class II component comprising at least a portion

comprising: (a) an MHC class II component comprising at least a portion

of an MHC class II alpha chain and at least a portion of an MHC class II beta

comprising the MHC class II alpha chain and MHC class II beta

chain form a peptide binding groove; (b) a spaceholder molecule; and (c)

an effector component, Also described; (l) a pharmaceutical composition

comprising the MHC class II molecule and a carrier; (2) a method of

producing an MHC class II compound; (3) a method of directly identifying

comprising the MHC class II compound; (3) a method of directly identifying

an antigen-specific T cell; (4) a method of tregulating an immune disorder in a subject;

in a subject; (5) a method of treating an immune disorder in a subject;

c) a method of treating an immune response ex vivo in a subject;

c) a method of treating an immune disorder ex vivo in a subject;

c) a method of treating an immune disorder ex vivo in a subject;

c) a method of treating an immune disorder ex vivo in a subject;

c) a method of treating an immune disorder ex vivo in a subject;

c) a method of treating an immune disorder ex vivo in a subject;

c) an etipacterial, antiparasitic, cytostatic and immunosuppressive

c) circuides, and can be used in gene therapy. The MHC class II compound

c) infections, peoplastic disease, autoimmunity or treating immune

c) and or opplastic disease, autoimmunity or treating immune

c) an MHC class II compound from the present invention.
                                                                                                                                                                                                                                                                                                                                                                    MHC class II compound; MHC class II component; MHC class II alpha chain; MHC class II beta chain; peptide binding groove; spaceholder molecule; effector component; immune response; immune disorder; virucide; antibacterial; antiparasitic; cytostatic; immunosuppressive; gene therapy; viral infections; bacterial infection; parasitic infection;

```
The present invention describes an isolated MHC class II compound (I)

comprising: (a) an MHC class II component comprising at least a portion

of an MHC class II alpha chain and at least a portion of an MHC class II beta

beta chain, such that the MHC class II alpha chain and MHC class II beta

comprising the MHC class II alpha chain and MHC class II beta

chain form a peptide binding groove; (b) a spaceholder molecule; and (c)

an effector component, Also described; (l) a pharmaceutical composition

comprising the MHC class II molecule and a carrier; (2) a method of

producing an MHC class II compound; (3) a method of directly identifying

comprising the MHC class II compound; (3) a method of directly identifying

an antigen-specific T cell; (4) a method of regulating an immune response ex vivo in a subject; and

(7) a method of regulating an immune response ex vivo in a subject; and

(7) a method of treating an immune disorder ex vivo in a subject; and

(7) a method of treating an immune disorder ex vivo in a subject; and

(7) a method of treating an immune disorder ex vivo in a subject; and

(8) a crivities, and can be used in gene therapy. The MHC class II compound

(1) can be used for preparing a composition for treating immune

(1) can be used for preparing a composition for treating immune

(1) can be used for preparing a composition for treating immune

(1) can be used for preparing a composition for treating immune

(2) disorders, e.g., viral infections, parasitic

(3) can offer a spaceholder molecule peptide, which can be used in

(3) can MHC class II compound from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New MHC class II compound, useful for preparing a composition for treating immune disorders e.g. viral infections, bacterial infections, parasitic infections, neoplastic disease, autoimmunity or toxicity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 11; SEQ ID NO 3; 92pp; English

                                                                                                                                                                                                                                                                                        ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a transgenic plant comprising a recombinant polynucleotide of any one of more than 500 nucleotide sequences fully defined in the specification or its complement. The method of the invention can be used to produced a plant having altered traits such as: enhanced tolerance to abiotic stress; glyphosphate tolerance; hormone sensitivity; disease resistance; sugar sensing; early or late flowering;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New transgenic plant comprising a recombinant polynucleotide of any one of more than 500 nucleotide sequences, useful in bioinformatic search

altered flower structure, change in stem bifurcations, altered branching pattern, reduced apical dominance, reduced trichome density; lack of trichomes reduced actopic trichome development; altered trithome development; increase in trichome number; altered stem morphology; increased root growth; increased root hairs; altered seed development; altered call proliferation or call differentiation; rapid development; premature senescence; increased necrosis; increase in seedling or plant size; decreased plant size; leaf morphology; seed morphology; seed biochemistry; increase in root anthocyanins; increase in plant anthocyanins, or alteration in light response or shade avoidance. The transgenic plant, polymucleotides and polypeptides are useful in bioinformatic search methods. This is the amino acid sequence of a plant transcription factor, and an orthologue of Arabiodopsis thaliana transcription factors isolated in the invention, that can be used in the creation of a transgenic plant with altered traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rice; transcription factor; plant; transgenic; abiotic stress; cold tolerance; heat tolerance; drought; osmotic stress; phosphate limitation; potassium limitation; nitrogen limitation; hormone sensitivity; disease resistance; sugar sensing; seed germination; flowering; inflorescence architectural change; meristem cell differentiation; phyllotaxy; apical dominance; trichome development; seed development; premature senescence; delayed senescence; lethality; necrosis; plant size; leaf morphology; secondary metabolism; light response; shade avoidance.

transgenic plant, useful in developing phenotypes with altered or improved characteristics or traits.

Claim 1; SEQ ID NO 989; 213pp; English

transcription relates to a transgence plant comprises a recombinant polymucleotide having a polymucleotide sequence or its complementary sequence comprising a sequence encoding a polymucleotide, that initiates transcription (i.e. a transcription factor) from Arabidopsis, Soybean, comprising as equence encoding a transgenic plant to agrow a progeny plant, an expression cassette (comprising as Abo01355). Also included are using a transgenic plant to grow a progeny plant, an expression cassette (comprising a constitutive inducible or tissue-specific promoter and a transgenic constitutive inducible or tissue-specific promoter and a transgenic cassette, producing a modified plant having a modified trait, identifying a factor that is modulated by or interacts with a polypoptide encoded by the polymucleotide sequence and identifying at least one downstream to plymucleotide sequence and identifying at least one downstream polymucleotide sequence and identifying a plant that has an altered transgenic plant is useful for producing a plant that has an altered transgenic plant is useful for producing a plant that has an altered transgenic plant is useful for producing a plant that has an altered transgenic plant is useful for producing a plant that has an altered transgenic plant is useful for producing a plant that has an altered transgenic plant is useful for producing a plant that has an altered transgenic plant is useful of drought, tolerance to obecased tolerance to drought, tolerance to obecased tolerance to prosphate limitation, colerance to potassium conformed transmittivity reduced sensitivity to bactical series and altered susceptibility to Fautoranium, altered susceptibility to Fautoranium, altered susceptibility to Fautoranium, altered susceptibility to seurodomonas syringae, altered susceptibility to series and massitum, altered susceptibility of plants increased for flowering, an inflorescence architectural change, altered susceptibility increased for hard morphology, altered susception of proiferation, alter The invention relates to a transgenic plant comprises a recombinant

```
ö
          content, an alteration of leaf glucosinolate content, change in seed biochemistry, an increase in seed oil content, decrease in seed faity acid content, increase in seed protein content, on seed protein content, increase in seed protein content, increase in seed protein in seed protein lipid content, increase in seed in seed in secondary metabolism, increase in root anthocyanins, increase in plant anthocyanins, and alteration in light response or shade avoidance. The present sequence represents an orthologue of a thalecress transcription factor isolated from Rice.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Plant; transcription factor; transgenic plant; abiotic stress tolerance; osmotic stress tolerance; cold tolerance; heat tolerance; low nitrogen tolerance; low phosphate tolerance; fungal disease; glyphosate resistance; flowering; fertility; seed development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel plant transcription factor proteins (I) and nucleotide sequences (II) (ADO61534-ADO63778). The sequences can be used to produce transgenic plants, which overexpress on the transgenic plant has an altered trait as compared to a non-transgenic plant or wild-type plant. The transgenic plant comprises an altered trait selected from increased tolerance to abiotic stress, increased tolerance to cold, increased germination in cold, increased tolerance to heat, increased germination in heat, increased tolerance to heat, increased increased tolerance to low nitrogen conditions, increased tolerance to low nitrogen conditions, increased tolerance to low phosphate conditions, increased tolerance to disease, including
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New recombinant polynucleotide encoding transcription factor polypeptides, useful for producing transgenic plants with advantageous properties compared to a reference plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Reuber TL;
increased leaf anthocyanins, an alteration of leaf fatty acid

                                                                                                                                                                                                                                                                                                                                                                                    molecule (I) comprising any of 113 fully defined nucleotide sequences given in the specification, their encoded protein sequences, sequences cgiven in the specification, their encoded protein sequences, sequences at least 60% identifying to the nucleotide sequences. The methods and cat least 60% identity to the nucleotide sequences. The methods and cat diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung. They are also used for identifying, tissue, monitoring and identifying and/or designing antagonists of the carrier of the invention, gene therapy, production of transgenic animals and production of engineered lung tissue for treatment and creater. Lung specific genes (LSGs) were identified by a systematic animals and production of engineered lung tissue for treatment and catalysis of gene expression adata in the LIFESEO Gold database using the data mining software package candidate lead automatic search program (CLASP). Genes were grouped into gene bins where each bin is a cluster of sequences grouped together where they share a common contig.

Composition of reach gene in libraries of normal tissues or non-tumour tissues from cancer patients were compared with the expression cumour tissues from cancer patients were compared with the expression levels in this unibraries associated with tumour or disease. This sequence represents a protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 plant protectant; plant growth regulant; gene therapy; plant; recombinant DNA construct; physical array; plant breeding marker; cold tolerance; heat tolerance; drought tolerance; herbicide tolerance; extreme osmotic condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistance; galactomannan production; lignin production; plant growth regulator; yield; plant growth; plant development; seed oil; protein yield; protein content.
                                                                                                                                                                                                                                               New isolated human lung specific nucleic acid molecule, useful for identifying, diagnosing, monitoring, staging, imaging and treating lung cancer and non-cancerous diseases of the lung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a new isolated lung specific nucleic acid

The invention describes a recombinant DNA construct comprising a polymucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at the invention are also useful in physical arrays of molecules and as of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme compositions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for inpressing the rate of homologous recombination in plants, for introgen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert polypeptide that can be used in the recombinant DNA construct of the
                                                                                                                              New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for improving yield.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Drosophila; developmental biology; cell signalling; insecticide;

Human, open reading frame, ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mallitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease; autoimmune disorder; rheumatoid arthritis; autoimmune thyroiditis;
                                                                                                                               The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
              detection reagent for detecting 1000 or more for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes substantially purified human proteins

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB37737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                              isolated nucleic acid detection reagent for detecting 1000 or more es from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Treating to as open reading trame, ORFX, where X is 1.11491 (see Table 1 in the specification). ABN15722 encode the human ORFX proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder. ORFX polynucleotide disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polynucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, costiasis, benign tumours, keloid, degenerative disorders, haemorrhage, osteoarthritis, neurodegenerative disorders, disorders related to organ cransplantation, cardiovascular diseases, diabetes mellitus, systemic lupus erythematosus, hyperthyroidism, cholesterol ester storage disease, various immune deficiencies and disorders, infectious carbinitis, autoimmune disorders such as multiple sclerosis, rheumatoid atheases, autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also conseful for treating burns, incisions, ulcers, for treating osteoporosis, bone degeneration and treatment of lung or liver fibrosis, corporection or regeneration and treatment of lung or liver fibrosis, systemic cytokine damage. NB. The sequence data for this patent did not for mpart of the printed specification, but was obtained in electronic form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
The invention relates to an isolated nucleic acid molecule modifying plant phenotypes and characteristics, comprising a nucleotide sequence that encodes an amino acid sequence exhibiting at least 85% sequence identity to an amino acid sequence in the sequence listing or in the ortholog alignments of Figure 1, a nucleic acid, which is a complement of (a), a nucleic acid, which is the reverse of the nucleotide sequence in (a) (such that the reverse nucleotide sequence has a sequence order which is the reverse of the sequence order of (a)) or a nucleic acid capable of
                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                         plant; transgenic plant; crop improvement; abiotic stress tolerance; plant growth regulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated nucleic acid molecule modifying plant phenotypes and characteristics and the polypeptide it encodes, useful for making transgenic plants with improved characteristics.
                                                                                                                                                                                                                                                      ö

hybridizing (a-c), under conditions that permit formation of a nucleic acid duplex at a temperature of 40-48 degrees C below the melting temperature of the nucleic acid duplex. Also included are a vector construct (comprising a first nucleic acid having a regulatory sequence of capable of causing transcription and/or translation in a plant, operably linked to a second nucleic acid having the sequence of the isolated nucleic acid molecule that is flanked by exogenous sequence, a host cell comprising the isolated nucleic acid molecule that is flanked by exogenous sequence, a host cell comprising the vector construct, an isolated polypeptide comprising an aniho acid sequence exhibiting at least 85* sequence identity to those cited above, introducing an isolated nucleic acid into a host cell, transforming a comprising the nucleic acid molecule, a plant generated from the plant cell or seed, a plant (plant cell, plant material or seed) comprising the nucleic acid molecule, a plant paying plant compared to a wild type plant), improving plant characteristics in a plant comprising transforming the plant with the nucleic acid sequence, and a transgenic plant having a gene construct (comprising the nucleic component operably linked to a plant promoter so that the component operably linked to a plant promoter so that the component operably linked to a plant promoter so that the component operably linked to a plant promoter so that the component to maturation, greater fruit or seed yield, higher tolerance to low phosphate concentration, or higher tolerance to low phosphate concentration, or higher tolerance to progenitor plant are cultivated under identical environmental conditions, where the component is any one of the polypeptides of the above. The nucleic acid molecules are useful for producing transgenic plants are useful for producing transgenic plants with a plant nucleic acid molecules are useful for producing transgenic plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       osteopathic; vulnerary; cytostatic; gene therapy; diagnosis; forensics; gene mapping; mutation identification; biodiversity; chromosome marker; immune response; myenloid cell disorder; lymphoid cell disorder; bone cartilage; tendon; ligament; nerve tissue growth; wound healing; burns; incision; ulcer; cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Wang J;

The invention relates to novel isolated polynucleotides or a sequence encoding a polypeptide with biological activity, where the polynucleotide hybridization conditions or has greater than 99% sequence identity with the polynucleotide. The polynucleotides and polypeptides are useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders and other traits, to assess biodiversity, as nutritional sources or supplements. The polynucleotides may also be used as molecular weight markers, chromosome markers or map related gene positions, or as an antigen to raise anti-DNA antibodies or elicit immune response. The polypeptides are useful for raising antibodies, as markers for tissues in which the corresponding polypeptide is expressed, for re-engineering damaged or diseased tissues, for treating myeloid or lymphoid cell calsoners, in home cartilage, tendon, ligament and/or nerve tissue growth cr regeneration, in wound healing, in tissue repair and replacement, in healing of burns, incisions and ulcers, and in treating cancer. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                         New polynuclectides and secreted proteins, useful for treating myeloid or lymphoid cell disorders, in bone cartilage, tendon, ligament and nerve tissue growth or regeneration, in wound healing, and in tissue repair and

                                                                                                                                                                                                        ô
                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16175, ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737) and ABB2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New recombinant DNA construct, useful for improving plant tolerance to cold, heat, drought, herbicides, extreme osmotic conditions, pathogens or pests, for conferring increased resistance to plant disease, or for improving yield.
                                                                                                                                                                                                                                                                                                                                                                                                 plant protectant; plant growth regulant; gene therapy; plant; recombinant DNA construct; physical array; plant breeding marker; cold tolerance; heat tolerance; drought tolerance; heat tolerance; extreme osmotic condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistance; yalatcomannan production; lighin production; plant growth regulator; yield; plant growth; plant development; seed oil; protein yield; protein content.

The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at a vailable in electronic form from the US patent office at the polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme camotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing galactomannan, lignin or plant growth regulators, for increasing the rate of homologous recombination in plants, for improving yield by modification of the cell by modification of photosynthesis or carbohydrate, mitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or centent. This is the amino acid sequence of a plant full length insert polypeptide that can be used in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 plant protectant; plant growth regulant; gene therapy; plant; recombinant DNA construct; physical array; plant breeding marker; cold tolerance; heat tolerance; drought tolerance; herbicide tolerance; extreme osmotic condition; pathogen tolerance; pest tolerance; growth rate; cell cycle pathway; disease resistence; all cycle pathway; disease resistence; yield; plant growth; plant growth regulator; yield; plant growth; plant development; seed oil; protein yield;

                                                                                                                           The invention describes a recombinant DNA construct comprising a polynucleotide consisting of a sequence encoding an amino acid sequence available in electronic form from the US patent office at t.p. seqdata.uspto.gov/sequence.html?DocID:2004034088. The polynucleotide of the invention are also useful in physical arrays of molecules and as plant breeding markers. The recombinant DNA construct is useful for improving plant tolerance to cold, heat, drought, herbicides, extreme someotic conditions, pathogens or pests, for manipulating growth rate in plant cells by modification of the cell cycle pathway, for conferring increased resistance to plant disease, for producing glaactomannan, increased resistance to plant disease, for increasing the rate of homologous recombination in plants, for improving yield by modification of photosynthesis or carbohydrate, nitrogen or phosphorus use and/or uptake or by providing improved plant growth and development under at least one stress condition or for modifying seed oil or protein yield and/or content. This is the amino acid sequence of a plant full length insert in the recombinant DNA construct of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                         recombinant DNA construct, useful for improving plant tolerance to , heat, drought, herbicides, extreme osmotic conditions, pathogens or s, for conferring increased resistance to plant disease, or for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is
                                                                                                                                                                    The invention relates to nucleic acids and encoded polypeptides which are cancer associated antigens expressed in patients afflicted with small cell lung cancer. The molecules provided by the invention can be used in the diagnosis, monitoring, research or treatment of conditions characterised by the expression of one or more cancer associated antigens. The polypeptide is used to treat a disorder characterised by expression of an expression of an abnormal amount of a protein encoded by a nucleic acid (NA) Group I molecule. The disorders are small and non-small cell lung cancer, melanoma, colon, breast, head and neck, or transitional cancer, leimyosarcoma or synovial sarcoma. The present sequence is human SOX3 protein, encoded by a small cell lung cancer associated gene designated as NY-SCLC-9
                                                 Isolated polypeptide, used to treat or prognose a disorder characterized by expression of a hCAAP e.g. cancer, is encoded by an isolated nucleic acid comprising an NA Group 3 or 4 molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Drosophila, developmental biology, cell signalling, insecticide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a transgenic fly whose genome comprises DNA encoding a polypeptide having the Abeta portion of human amyloid precursor protein (APP), tused to a signal sequence. The DNA sequence encodes a 123 (Abeta40) or 129 (Abeta42) amino acid sequence, given in the specification. The DNA sequence is operably linked to a tissuethe specific expression control sequence. Expression of the sequence gives the fly an altered phenotype. The purpose of the invention is for identifying agents that inhibit or promote the expression and/or function of genes or encoded polypeptides which modify the APP pathway. The agent is a compound, triple helix DNA, antisense oligonucleotide, double stranded RNA molecule, ribozyme, or particularly an antibody. It is used to treat conditions such as Alzheimer's disease. The agent can be used as an APP pathway modulator or in gene therapy. This sequence represents the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Neuroprotective; nootropic; transgenic fly; Alzheimer's disease; Abeta; amyloid precursor protein; tissue-specific expression control; human APP; APP pathway modulator; gene therapy.
useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL3631), expressed DNA sequences (ABL0176-ABL3631), expressed DNA sequences (ABL0176-ABL3631), expressed DNA ABB2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New transgenic fly, containing DNA encoding an Abeta portion of human APP, useful for identifying agents which modulate the APP pathway and which can be used to treat Alzheimer's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   function
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               stranded Manlecule, Tibozyme, or particularly an antibody. It is used to treat conditions such as Alzheimer's disease. The agent can be used as an APP pathway modulator or in gene therapy. This sequence represents the protein of the APP related human homologue hCP41313 #2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a transgenic fly whose genome comprises DNA encoding a polypeptide having the Abeta portion of human amyloid precursor protein (APP), fused to a signal sequence. The DNA sequence encodes a 133 (Abeta40) or 129 (Abeta42) amino acid sequence, given in the specification. The DNA sequence is operably linked to a tissue-specific expression control sequence. Expression of the sequence gives the fly an altered phenotype. The purpose of the invention is for identifying agents that inhibit or promote the expression and/or function of genes or encoded polypeptides which modify the APP pathway. The agent is a compound, triple helix DNA, antisense oligonuclectide, double
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New transgenic fly, containing DNA encoding an Abeta portion of human APP, useful for identifying agents which modulate the APP pathway and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                and polypeptides. Also disclosed are vectors, expression cassettes, host cells, and plants containing such polynucleotides. Also disclosed are nethods for using the polynucleotides and polypeptides to alter the responsiveness of a plant to abiotic stress. The invention is useful in agriculture. The nucleic acid is useful for determining whether a test plant has been exposed to an abiotic stress condition. It is also useful for selecting an agent that alters abiotic stress regulated polynucleotide expression in a plant cell, and to identify a homolog or ortholog to an abiotic stress responsive polynucleotide. The nucleic acid molecule and the polypeptide encoded by it are useful in altering the responsiveness of a plant to an abiotic stress, such as cold stress, sattess, osmotic stress or any of their combinations. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New stress-responsive nucleic acid, useful for altering the responsiveness of a plant, e.g. cereal, to an abiotic stress such as cold stress, salt stress or osmotic stress.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to novel abiotic stress responsive polynucleotides

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed constitution of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed activity of (II) or to treat disease states involving (II). (II) is constituted in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging cyllypeptide in tissue, as molecular weight markers and as a food states expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders of sites expression or biological activity. The polypeptide and polynucleotide sequences have applications in cresponsible for genetic disorders or other trails to assess biodiversity and to produce other types of data and products dependent on DNA and canno acid sequences of the invention. Note: The sequence data for this mino acid sequences of the invention. Note: The sequence data for this center tid not appear in the printed specification, but was obtained in celectronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

```
The present invention describes a superantigen binding site within the CD28 molecule that specifically and directly binds to a superantigen. Also described: (1) a method for treating a superantigen-related disorder in a mammalian subject; (2) a method of inhibiting pyrogenic exotoxin-mediated activation of Th1-1ymphocytes and protecting against toxic shock induced by a pyrogenic exotoxin or by a mixture of pyrogenic exotoxins, in a subject; (3) a method of eliciting protective immunity against toxic shock induced by a pyrogenic exotoxin in a subject; (4) a substance that inhibits the binding of a superantigen to a superantigen binding site in CD28; (5) a pharmaceutical composition for treating or preventing superantigen-related disorders comprising the substance that inhibits the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        preparing a pharmaceutical composition for treating superantigen-related disorders caused by Staphylococcus aureus or Streptococcus pyogenes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               direct interaction between CD28 molecule and the pyrogenic exotoxin, which leads to antagonising of toxin-mediated activation of Thi hyphocytes; (6) an isolated and purified peptide having an amino acid sequence homologous to an amino acid sequence comprised within a sequence comprised within a servening for a test substance which specifically binds to the CD28 molecule and is capable of antagonising pyrogenic exotoxin-mediated activation of Thi lymphocytes and optionally of eliciting protective immunity against toxic shock induced by a pyrogenic exotoxin or by a mixture of at least two pyrogenic exotoxins; and (8) a method of preparing a therapeutic composition for treating a superantigen-related disorder in a mammalian subject. The substance and pharmaceutical composition have antibacterial activities, and can be used in gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New superantigen binding site within the CD28 molecule, useful for
                                                                                                                                                                                          superantigen binding site; CD28; superantigen; antibacterial; gene therapy; superantigen-related disorder; epitope.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         therapy. The substance, peptide or CD28 molecule can be used
                                                                                               SCD28 molecule related motif peptide SEQ ID NO:7.

The present sequence is that of a peptide of potential use for production of a coded probe useful in the method of the invention. The sequence was obtained by solid-phase peptide synthesis, and is predicted to be an alpha helix. The invention provides methods, apparatus and compositions for the detection, identification and/or sequencing of biomolecules, such as nucleic acids or proteins. Coded probes comprising a probe molecule attached to one or more nano-barcodes are allowed to bind to target molecule (s). After binding and separation from unbound coded probes, the bound coded probes are aligned on a surface and analysed by scanning probe microscopy (SPM). The nano-barcodes may be any molecule or complex that is distinguishable by SPM, such as carbon nanotubes, fullarenes; submaritner metallic barcodes, nanoparticle or quantum dots. The methods allow the sequencing of long nucleic acids equences in a single sequencing run, high speed of obtaining sequence data, low cost of sequencing and high efficiency in terms of operator time, and sensitive and accurate detection and/or identification of nucleic acids with low incidence of false positive results.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ..

The invention relates to a method for determining a nucleotide sequence of a nucleic acid. The method comprises: (a) providing one or more coded oligonucleotide probes, each coded oligonucleotide probes comprising an oligonucleotide associated with at least one nanocode comprising a detectable non-encoding feature, (b) contacting a target nucleotide acid with the one or more coded oligonucleotide probes; and (c) identifying coded oligonucleotide probes; and (c) identifying using scanning probe microscopy (SPM) to detect the nanocode and the detectable non-encoding feature. Nanocodes of the invention in certain aspects include detectable features beyond the arrangement of tags that encode information about the barcoded object. The tags that encode information about the barcoded object. The detectable features include structures of a nanocode or associated with a nanocode, referred to as detectable feature tags, for error.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       checking/error correction, encryption and data reduction/compression. The present sequence represents a synthetic peptide which connects four buckeyballs on graphite in an example from the present invention, where the example is about the synthesis and SPM scanning of a nanocode.
                                                                                                                                                                                                                                                                                                                                                                                                                                                 Identifying target nucleic acid sequence, by contacting target nucleic acid with coded oligonucleotide probes, and identifying probes binding to

human prostate, colon, lung and breast cancer CDNA libraries, and to 57 proteins (ADNI3971-ADNI4027) encoded by a subset of these CDNA sequences proteins (ADNI3971-ADNI4027) encoded by a subset of these CDNA sequences (ADNI3914-ADNI3970). The invention also relates to vectors and host cells comprising a nucleic acid of the invention; a method for the recombinant production of a protein of the invention; a method for the recombinant protein of the invention; a method for detecting a cancerous cell by PCR or probe hybridisation; inhibiting at least concervous concerved electrically aberrant proliferation) of a cell; a method of chencype (particularly aberrant proliferation) of a cell; a method of product differentially expressed in a cancerous cell; and a method of treating a cancerous concerved interesting a cancerous concerved interesting a cancer with a contain cell; and a method of treating a cancer patient using the agent commal cell; and a method of treating a cancer patient using the agent of normal cell; and a method of treating a cancer patient using the agent of concerved interesting a cancer patient using the agent of prognose, treat or prevent cancers such as prostate, colon, lung or breast cancer, and can also be used to screen for drugs for the treatment of cancers. The nucleic acids can also be used for gene mapping, tissue to propried and tissue profiling. The present sequence represents a cyping and tissue profiling. The present commance data for this patent did not form part of the printed prom when was obtained in electronic form at the printed form was obtained in a lengtronic format directly from with the printed promise.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                               profiling, as diagnostic reagents, and for gene mapping or tissue typing or e.g. prostate, colon, or breast cancer.

                                                              The invention relates to a nucleic acid probe for measuring human gene expression, comprising any of the 27,400 fully defined nucleotide sequences in the specification, or their complements or fragments, and encoding at least 8 amino acids of any of the 6888 amino acids acquences ("Illy defined in the specification. The probe is a single exon probe that hybridises under high stringency conditions to a nucleic acid molecule expression (comprising a plurality of probes for measuring human cells or tissues. Also included are a spatially—adversable set of single exon nucleic acid probes for measuring human gene expression, a method of and addressably isolatable or amplifiable from the plurality, a single exon addressably isolatable or amplifiable from the plurality, a single exon addressably isolatable or amplifiable from the plurality, a single exon addressably isolatable or amplifiable from the plurality, a single exon addressably isolatable or amplifiable from the plurality, a single exon probe cited above, where each of the plurality of probes cited above, where seed of the above—mentioned amino acid of contiguous amino acids of any of the above—mentioned amino acid of contiguous amino acids of any of the above—mentioned amino acid of sequences (optionally with conservative amino acid substitutions), an isolated antibody that binds specifically to a peptide cited above, methods of selling and/or licensing single exon probes or microarrays to a customer desiring to measure gene expression, a method of providing human gene expression data by subscription, and a computer-readable expression analysis. The probes may be used as tools for surveying clack above. The probes may be used as tools for surveying clack above. The probes are used in identifying and characterising cross of the probes are used in identifying and characterising secure. In addition, the probes are used in identifying and characterising calternative splicing events, in priming the synthesis of nucleic acids. In expressing the ORF-encoded peptide.
                                                                                                                                                                                                                                                                                      New human genome-derived single exon nucleic acid probes useful for human gene expression analysis, for identifying or characterizing alternative splicing events, for assessing genomic alterations or as tools for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DB 8; Length 109;

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

biodiversity.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain acaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed control in gene therapy techniques to reserve normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a cupylement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in disorders responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and to produce other types of data and products dependent on DNA and amino acid sequences. ABG0010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fit, wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        80.0%; Score 40; DB 4; Length 112; 83.3%; Pred. capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-ABB77072). The sequence data for this patent did not form part of the from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                     New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cytostatic; antipsoriatic; antiinflammatory; gene therapy; Nanodisc; proliferative disorder; inflammatory disorder; immune disorder; metabolic disorder; bone disorder; CNS disorder; cancer; psoriasis;
                                                                                                                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid detection reagent

invention.

```
The invention relates a recombinant DNA construct comprising a CC polymucleotide having any of 5544 mucleotide sequences (CDNAs SEQ ID NO: CD polymucleotide having any of 5544 mucleotide sequences (CDNAs SEQ ID NO: 5545-11088). The CDNAs and procteins are from corn. Soybean, CSC (SEQ ID NO: 5545-11088). The CDNAs and procteins are from corn. Soybean, CSC (SEQ ID NO: 5545-11088). The CDNAs and procteins are from corn. Soybean, CSC producing a plant having an improved property, comprising transforming a plant having an improved property, comprising transforming a plant with a recombinant DNA construct comprising promoter region (CC plant) in a plant cell operably joined to a polymucleotide encoding a COLYpeptide associated with the property, and growing the transformed collymptide associated with the property, and growing the transformed collamingulating growth rate in plant cells by modification of the cell cycle pathway, for improving plant tolerance to plant disease, for galactomannan production, for production of plant sowth regulators, for improving plant tolerance to herbicides, for increasing the rate of improving plant tolerance to herbicides, for increasing the rate of homologous recombination in plants, for lighn production, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to extreme osmotic conditions, for improving plant tolerance to pathogens or pests, for yield improvement by modification of collection of carbohydrate, nitrogen or phosphorus use and/or uptake and for yield improvement by providing improved plant growth and

                                                                                                                                                                                     ö
development under at least one stress condition. The polynucleotide may also encode a plant transcription factor. The methods and compositions of the present invention are useful in the field of blochemistry and centrollar for producing transgenic plants with improved biological characteristics such as increased yield, improved nitrogen flow, increasing plant tolerance to cold or heat, improving plant tolerance to extreme osmotic and drought conditions, and improving plant tolerance to plant pests or pathogens. They can also be used in physical arrays of molecules, plant breeding markers, computer-based storage and analysis systems. The present sequence is one of the 5544 plant protein nequences of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in sequence. Lettronic format directly from USPTO at
                                                                                                                                                                                     Gaps
                                                                                                                                                                                     ..
                                                                                                                                                                                                                                                                                                                                                  Plant, C-repeat/DRE binding factor; CBF; transgenic; biomass; cold inducible promoter; environmental stress; cold tolerance; cell injury; growth inhibition; drought; high salt condition.

The invention relates to a transgenic plant having an altered trait as compared to a wild type or untransformed plant. The trait is altered, i.e. increasing or decreasing levels of at least one cell protectant in cells of the transgenic plant to raltered, i.e. increasing or decreasing levels of biomass, where the transgenic plant is transformed with a cells of blomass, where the transgenic plant is transformed with a creombinant polymucleotide comprising an AP2 domain. Also a Crepeat/DRE binding factor (CRP) comprising an AP2 domain. Also included are a cold inducible promoter comprising an AP2 domain. Also control of the Rable or Dreb2a promoters, a method of inducible protectant in a cell, a method for inducible levels of a cell protectant in a cell, a method for controling the levels of a cell protectant in a plant cell, a method for improving the tolerance and a method of altering the biomass of a plant. The improved environmental stress is selected from a decrease in certain of of a plant is or a cell is injury, plant is growth inhibition, increase in survival response to freezing temperatures, survival rate after exposure to freezing temperatures, cextent of a plant after exposure to drought conditions, cextent of a plant after exposure to drought conditions, cextent of a plant after exposure to drought conditions, cextent of a plant after exposure to drought conditions, cextent of a plant after exposure to drought conditions, cextent of a plant after exposure to drought conditions, cextent of a plant after exposure to high salt conditions, and which has an increased tolerance be an environmental stress, e.g. drought, cold, the present sequence represents a plant CBF or handled an environmental stress, e.g. drought, cold, the present sequence represents a plant CBF or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New transgenic plants comprising C-repeat/DRE binding factor, useful in producing phenotypes with increased tolerance to an environmental stress. e.g. drought, cold, freezing or high salt.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         glyphosphare tolerance; hormone sensitivity; disease resistance; sugar sensing; flowering; flower structure; stem bifurcation; branching pattern; apical dominance; trichome; stem morphology; root growth; root hair; seed development; cell proliferation; cell differentiation; premature sensecence; necrosis; plant size; leaf morphology; seed morphology; seed biochemistry; root anthocyanin;

```
The invention describes a transgenic plant comprising a recombinant polynucleotide of any one of more than 500 nucleotide sequences fully defined in the specification or its complement. The method of the invention can be used to produced a plant having altered traits such as: enhanced tolerance to abiotic stress; glyphosphate tolerance; hormone sensitivity; disease resistance; sugar sensing; early or late flowering; altered flower structure, change in stem biturcations, altered branching pattern, reduced apical dominance, reduced trichome density; lack of trichomes; reduced ectopic trichome development; altered trichome development; increase in trichome number; altered stem morphology; increased root growth; increased root hairs; altered seed development; premature senescence; increased nor cell differentiation; rapid development; premature senescence; increased morphology; seed development; premature senescence; increased morphology; seed size; decreased plant size; leaf morphology; seed plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       biochemistry; increase in root anthocyanins; increase in plant anthocyanins, or alteration in light response or shade avoidance. The transgenic plant, polymucleotides and polymeptides are useful in bioinformatic search methods. This is the amino acid sequence of a plant transcription factor, and an orthologue of Arabiodopsis thaliana transcription factors isolated in the invention, that can be used in the creation of a transgenic plant with altered traits.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New transgenic plant comprising a recombinant polynucleotide of any one of more than 500 nucleotide sequences, useful in bioinformatic search
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Haake V;

Also described are: a transgenic plant produced by the method above; a seed produced by the transgenic plant, where the seed comprises the second or third plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 polynucleotide; and a transgenic plant comprising a recombinant, overexpressed mutated polynucleotide that encodes a mutant member of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CBF clade of transcription factor polypeptides, where the transgenic plant exhibits fewer or reduced adverse morphological or developmental effects than a plant that overexpresses a wild-type form of the mutated polynucleotide. The method is useful for producing a transformed plant having increased abiotic stress tolerance, as compared to wild type or control plants. This is the amino acid sequence of a CBF clade
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                     The invention describes a method of producing a transformed plant comprises transforming a target plant with the first polynucleotide, which is a member of the Case of transcription factors, and iss mutagenized to produce a second or a third polynucleotide, where the second or third polypeptide has an amino acid sequence different than the first polypeptide, and identifying a transformed plant comprising the second polynucleotide and identifying a transformed plant comprising the transgenic plant produced by the method above; a seed produced by the transgenic plant, where the seed comprises the second or third overexpressed mutated polynucleotide that encodes a mutant member of the CBF clade of transcription factor polypeptides, where the transgenic
                                                                                                                                                                                                                                                                   Producing transformed plant, by transforming a target plant with a first polynucleotide, which is a member of the CBF clade of transcription factors, and which is mutagenized, and identifying a transformed plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              plant exhibits fewer or reduced adverse morphological or developmental effects than a plant that overexpresses a wild-type form of the mutated polymucleotide. The method is useful for producing a transformed plant having increased abiotic stress tolerance, as compared to wild type or control plants. This is the amino acid sequence of a CBF clade transcription factor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

Sequence 232 AA;

```
The invention describes an isolated polynucleotide comprising a nucleotide sequence selected from 124 nucleotide sequences (SEQ ID NO: 1-
124), or a polynuclectide encoding a polypeptide with biological
cetivity, where the polynucleotide hybridises to the nucleotide sequence
under stringent hybridisation conditions or has greater than 99% sequence
condensity with the nucleotide sequence. The polynucleotide or the encoded
condensity with the nucleotide sequence. The polynucleotide or the encoded
condensity with the nucleotide sequence. The polynucleotide or the encoded
condensity dentification of mutations responsible for genetic
disorders or other traits, to assess biodiversity, and to produce many
cother types of data and products dependent on DNA and amino acid
consists. The polynucleotide or the polypeptide is useful in methods for
sequences. The polynucleotide or the polypeptide is useful in methods for
corporating and/or treating disorders and for treating
contribution or biological activity e.g., cancer, as nutritional sources or
supplements. The polypeptide is useful for regulating hematopoiesis and
control manned disorders such as multiple sclerosis, rheumatoid architis,
autoimmune disorders such as multiple sclerosis, rheumatoid architis,
contominance of regeneration, as well as in wound healing and tissue
crepair and replacement, and in healing of burns, incisions and ulsers,
for treating osteoporosis, osteoarthritis, bone degenerative disorders,
cor periodontal disease. The composition is useful in assays for
corporiserating nerve and or harding second nervel for reating centerating nerve and for periodontal and praint state is an exposite or experient and replacement, and the health of the confosition and differentiation, for proliferating centeral disease. The composition is useful in assays for
corporation and differentiation of various hematopoietic lines, assays
conditions and replacement and replacement and composition is useful and praint and replacement and composition is useful and praint an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention describes a method of treating a mammal having a tumor of glial origin comprising cells that express a type A or B glial tumor antigen comprises contacting the cells with a composition of a first binding agent comprising a first antibody, oligopeptide or organic molecule that binds to a type A or B glial tumor antigen; and a second binding agent comprising a second antibody, oligopeptide or organic molecule that binds to a type B or A glial tumor antigen. Also described is a method of determining the presence of a type A or B glial tumor in a mammal. The method is useful in treating a mammal at unor of glial origin comprising cells that express a type A or B glial tumor of glial origin comprising cells that express a type A or B glial tumor antigen. This sequence represents a human tumor-associated antigenic target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Treating a mammal having a tumor of glial origin comprising cells that express a type A or B glial tumor antigen by contacting the cells with a composition comprising first and second binding agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
